

Step 3

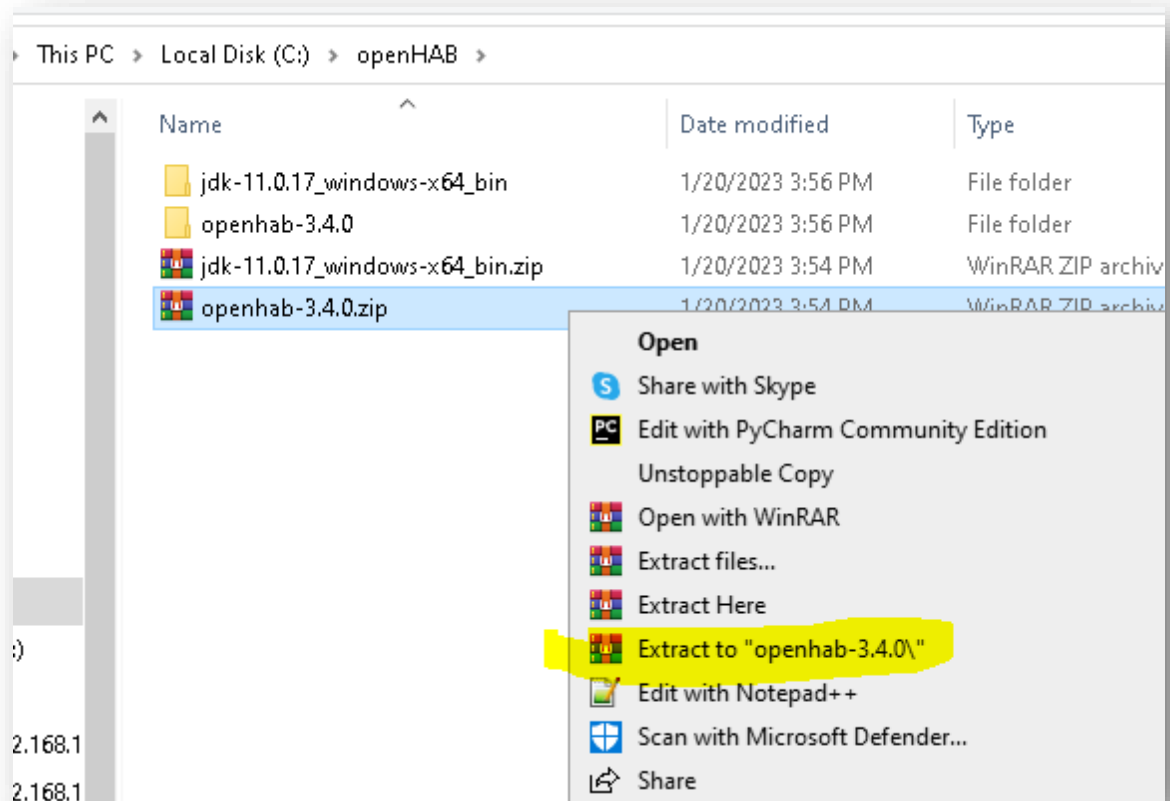

Java Installation and Configuration

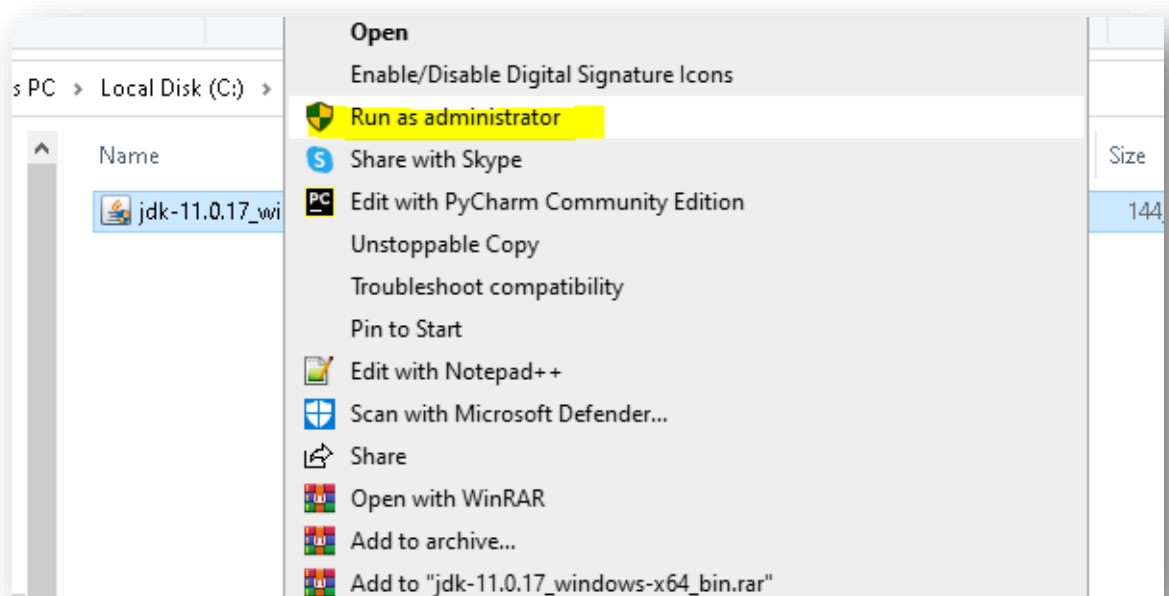

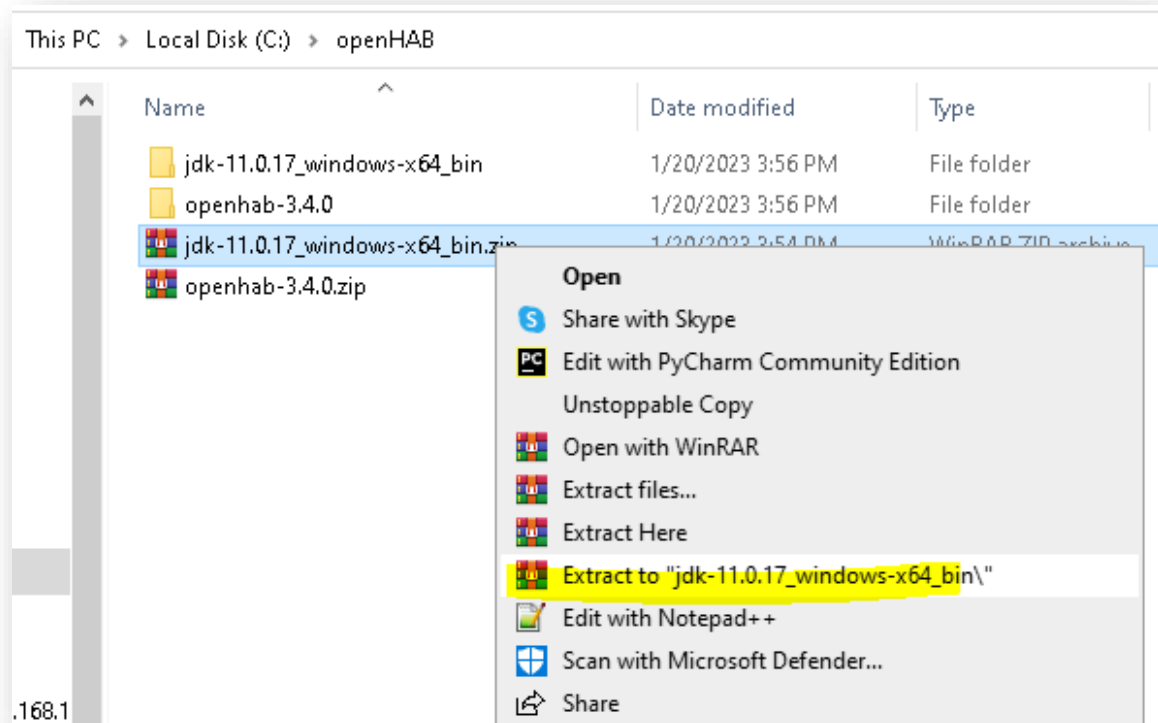

Follow the steps below

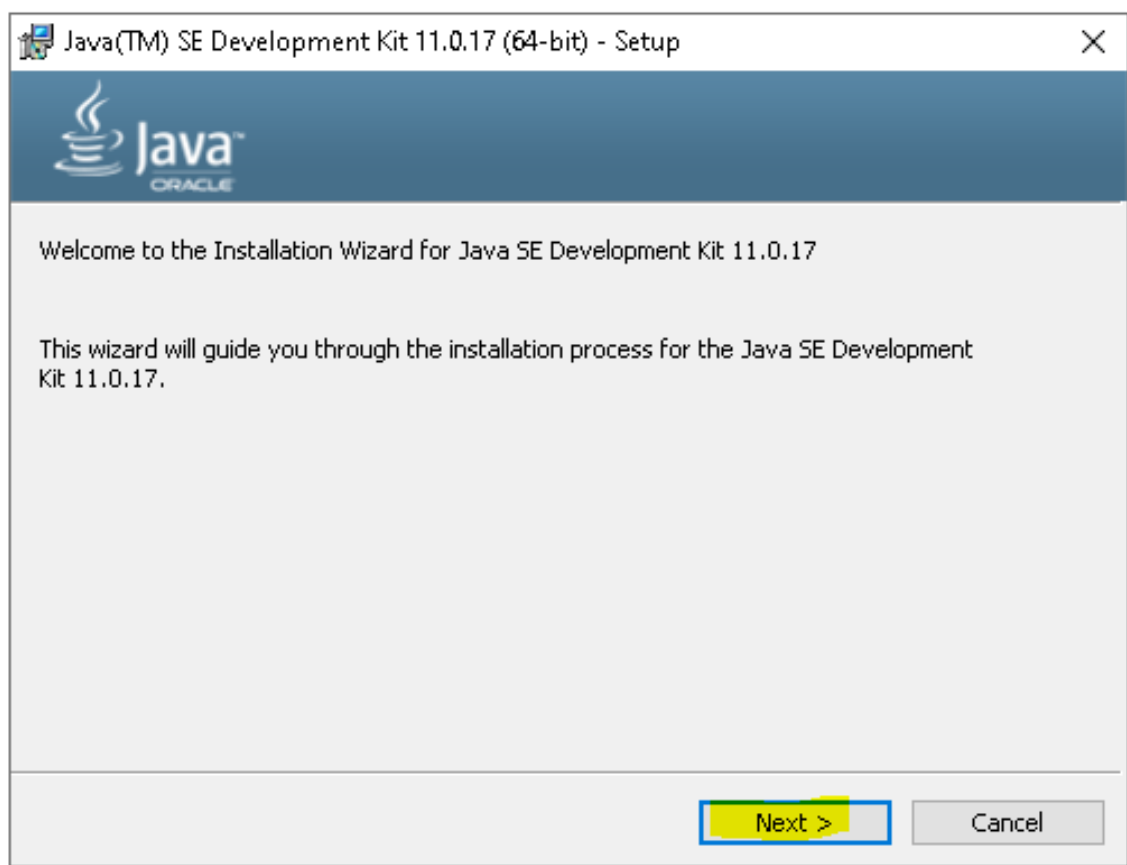

1. Download [OpenHAB](#) and Java ([jdk-11.0.17_windows-x64_bin.zip](#)) and Extract

both zipped files (or you can download these from their own respective sites)

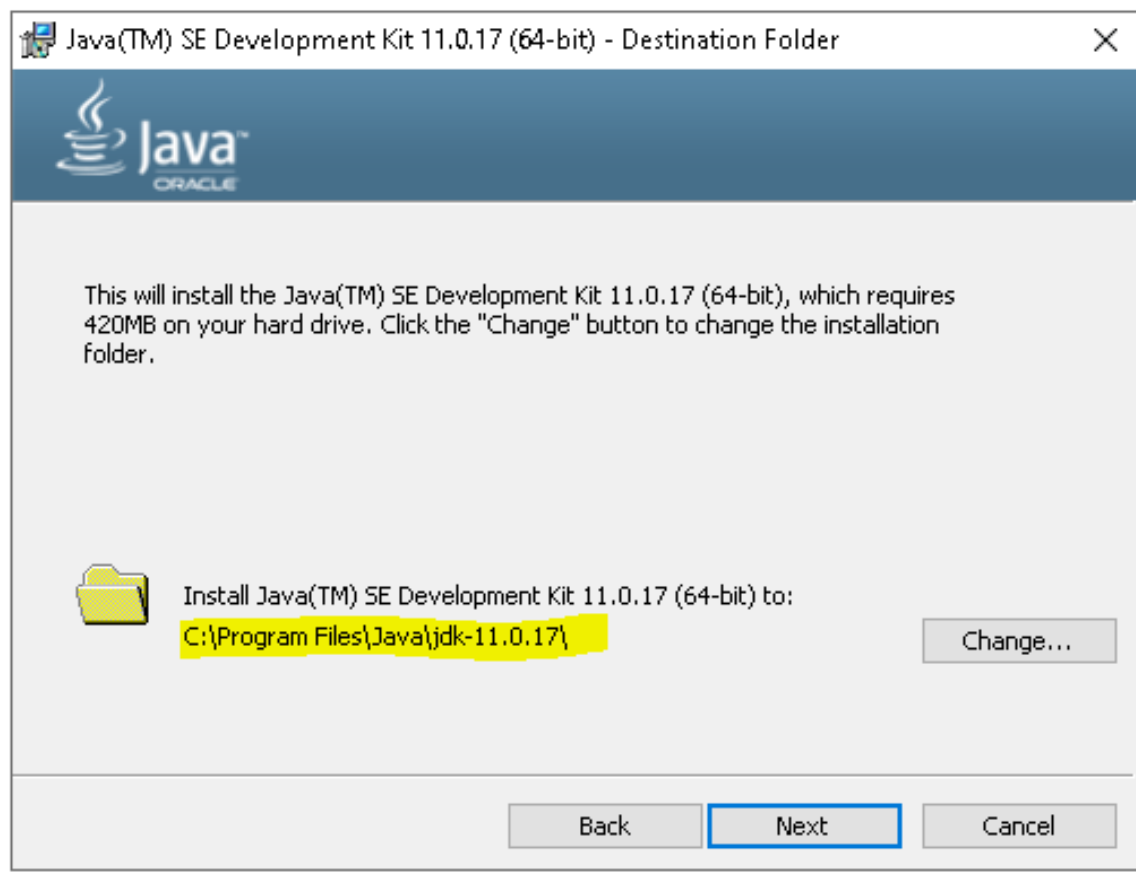

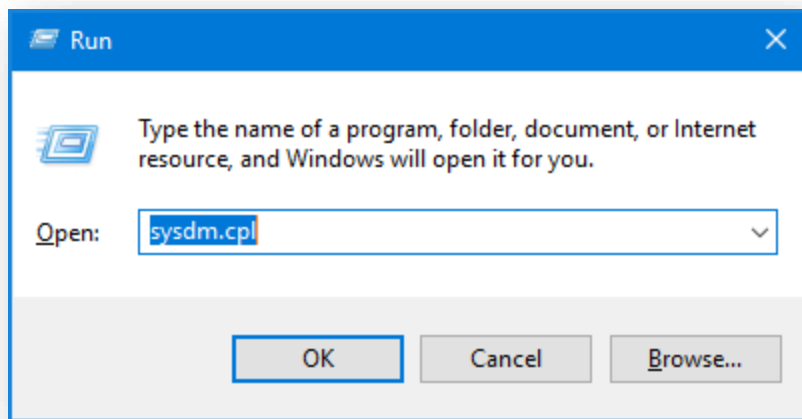

[Note] take note of the location of the installation, as you will be needing this later

Once installation completed

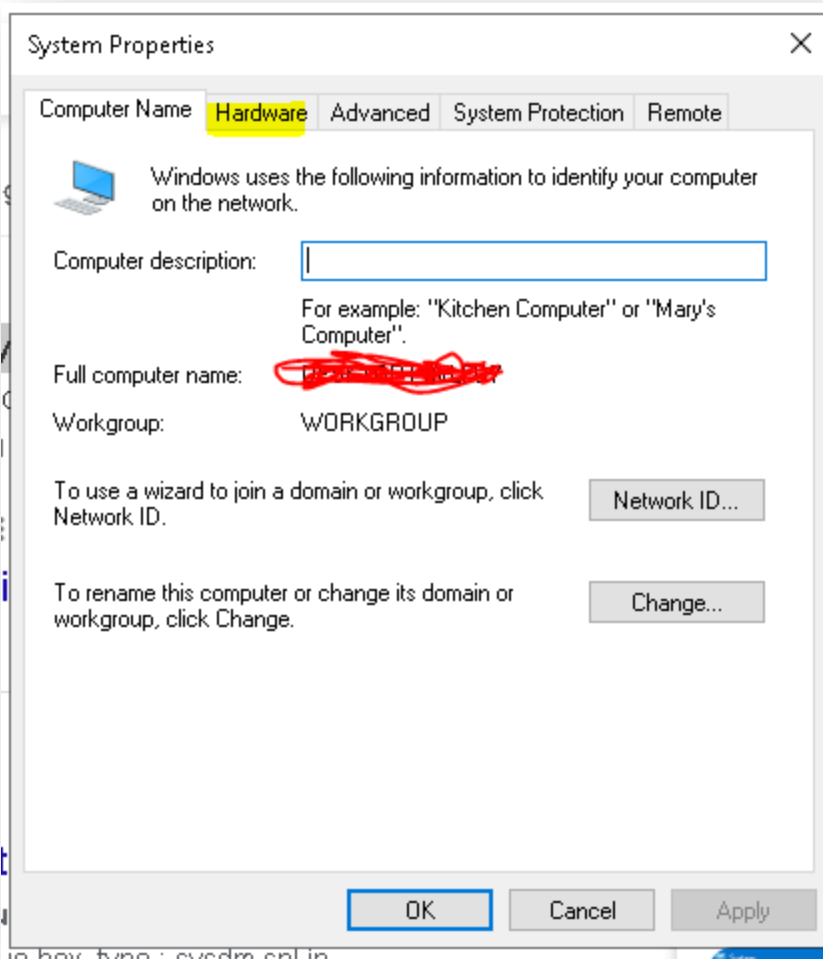

We need to configure the environment variable for the JAVA_HOME

Open RUN and enter "SYSDM.cpl"

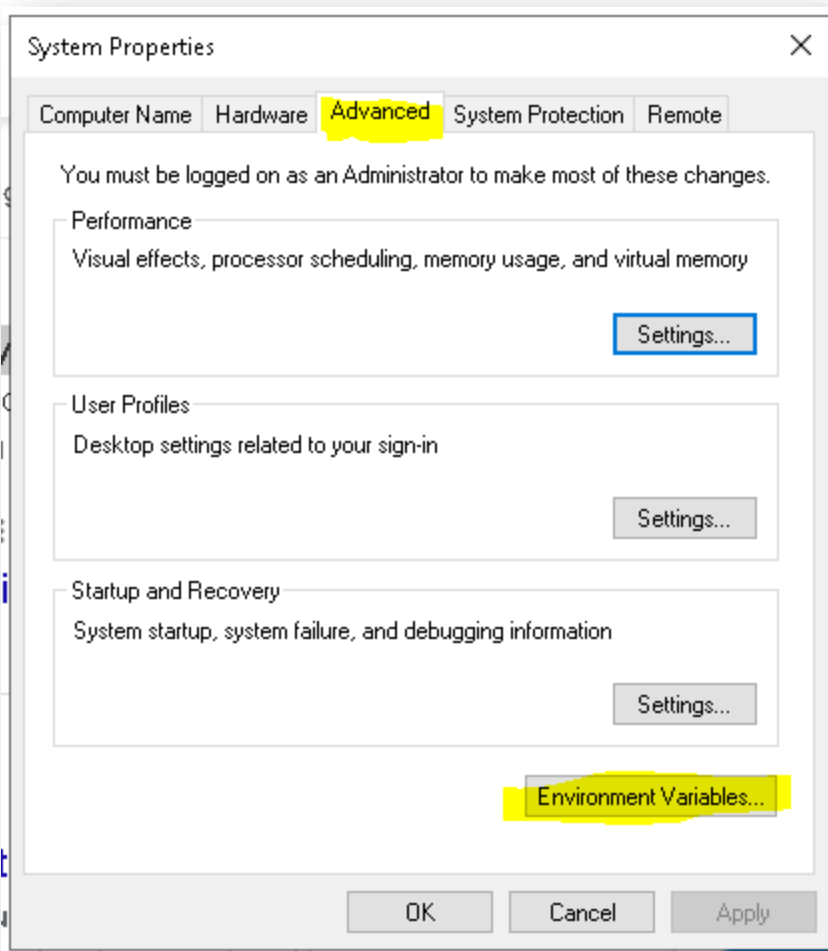

A dialog box will ask to allow the app, just click the “YES” button

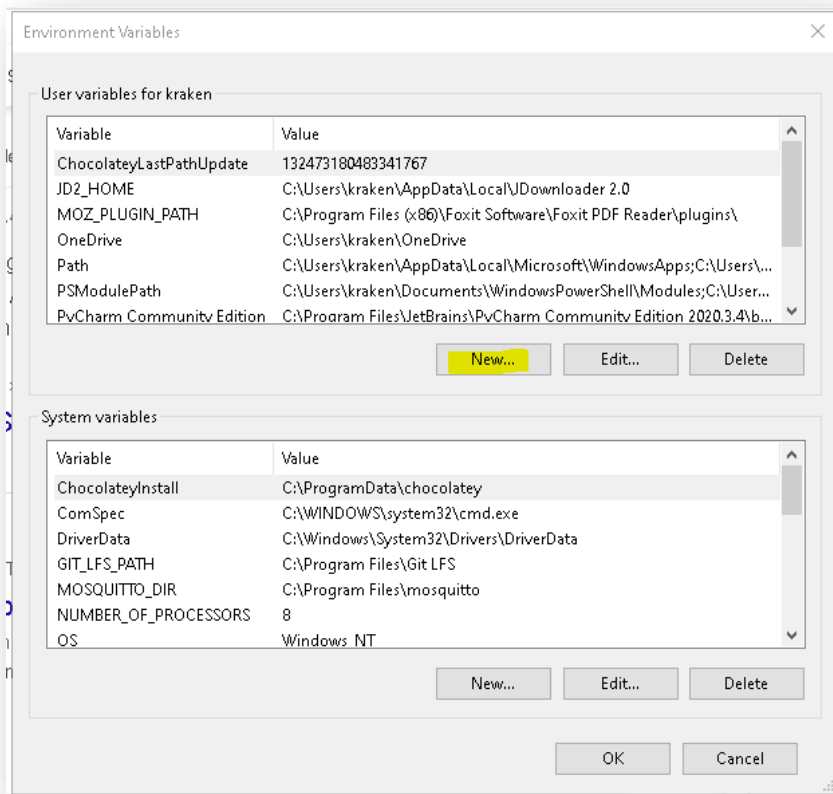

Below system properties

Click **Advanced** tab and then **Environment Variables**

If not yet available, click NEW to create the **JAVA_HOME** path

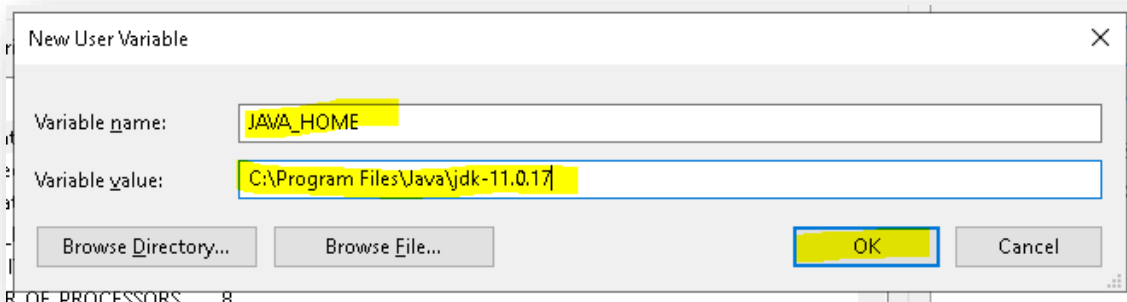

For the Variable name enter **JAVA_HOME**

And for the Variable value add the installation path of the java

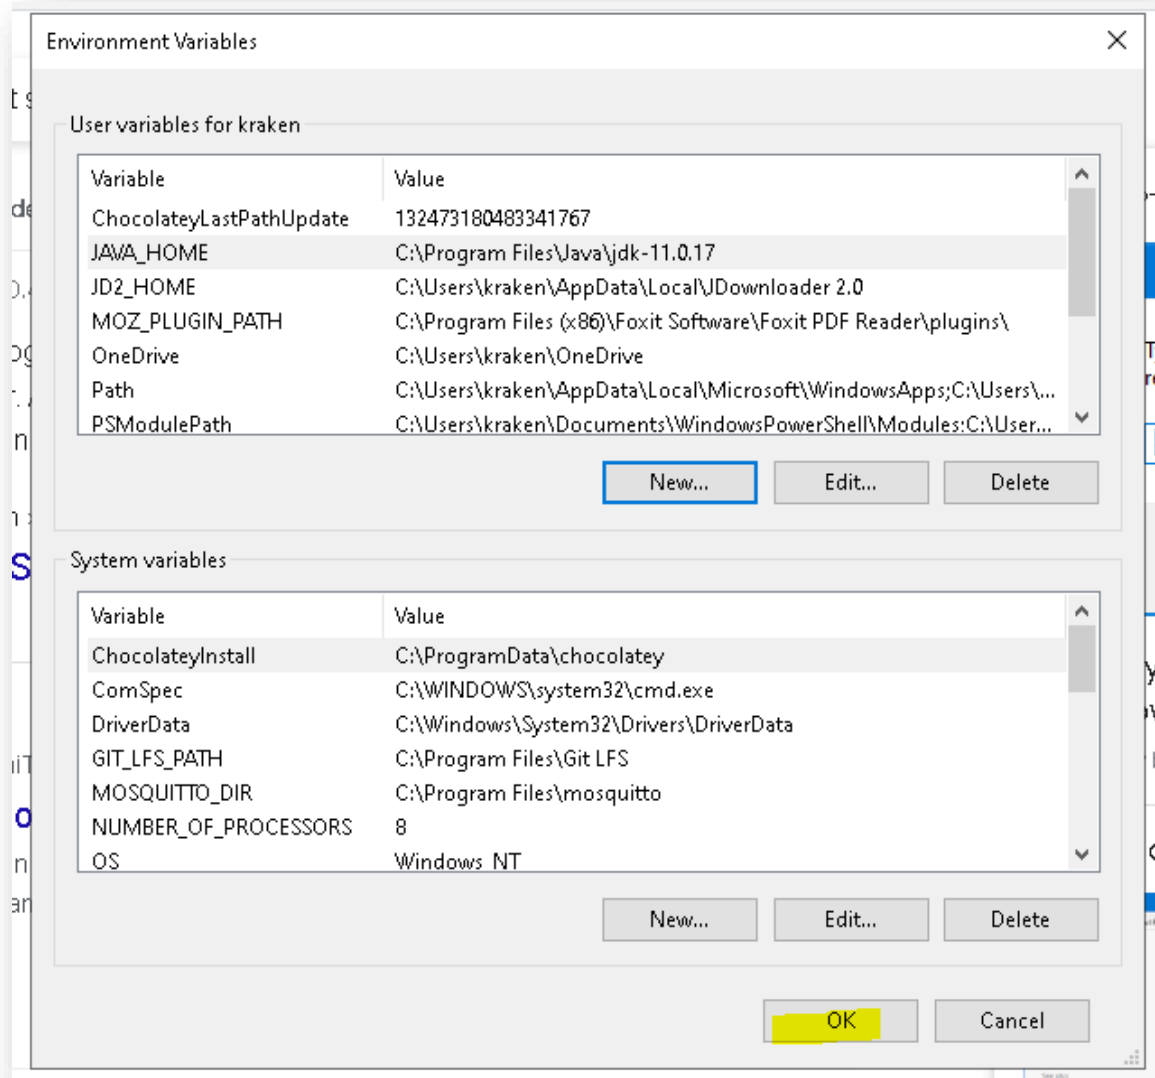

Below example, and note this may not be the same with you as mine,

so you have to input the correct location otherwise

Once you confirmed everything are correct you can then go ahead and

click the OK button thrice to complete the task.

This completes the STEP 3 (JAVA installations)

Proceed to STEP 4 (Start OpenHAB Web Server)

End
