

Step 1

KAMOTEQ Firmware Upload

(I am using Windows 10 when doing this procedures)

Download the following files from the GitHub repository

- a. kamoteq-main-firmware-bin-files.zip
- b. nodemcu-flasher-master.zip

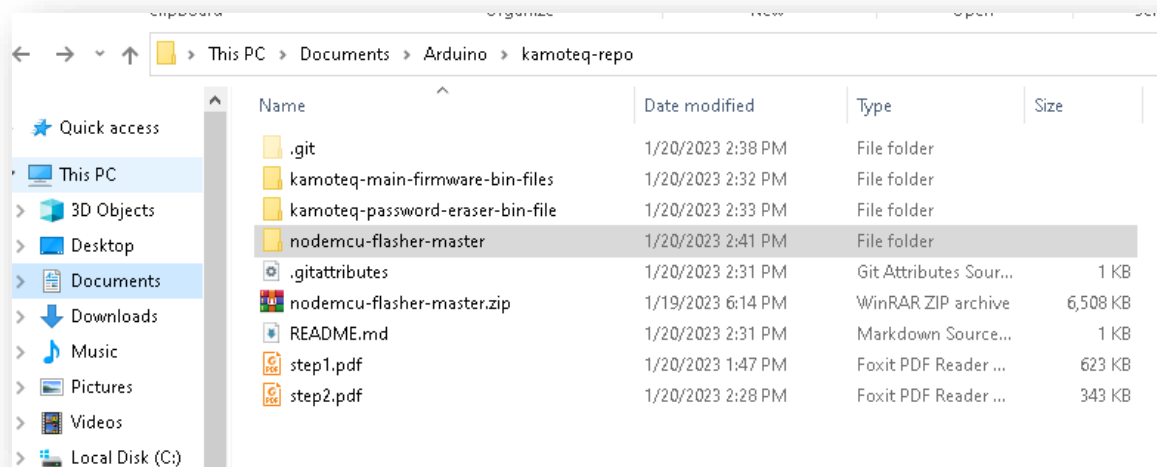

from <https://github.com/kamoteqv2/kamoteq-repo>

and save them on your computer

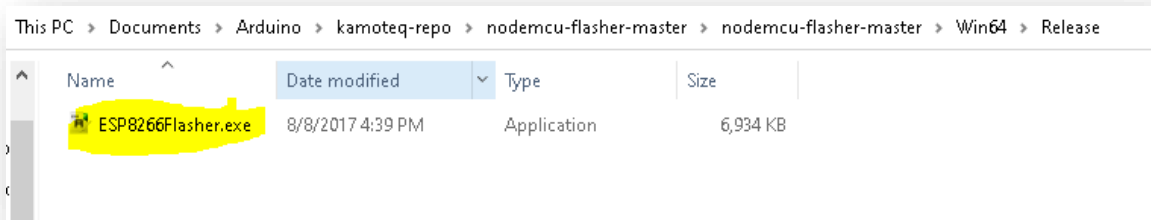

Step1 - KAMOTeq Firmware Upload.pdf	Update Step1 - KAMOTeq Firmware Upload.pdf
Step2 - WIFI Network Registration.pdf	up
Step3 - Java Installation and Configur...	up
Step4 - Start OpenHAB Web Server.pdf	up
Step5 - Initial OpenHAB configuratio...	up
Step6 - KAMOTeq enabled esp8266 ...	up
Step7 - Enabling a new Switch PIN.pdf	Update Step7 - Enabling a new Switch PIN.pdf
ipscan-win64-3.9.0.zip	up
kamoteq-main-firmware-bin-files.zip	Create kamoteq-main-firmware-bin-files.zip
lab-setup.jpg	Update lab-setup.jpg
nodemcu-flasher-master.zip	up
openhab-3.4.0.zip	up
openhab_sensor_sample.txt	up
openhab_switch_sample.txt	up
portty.zip	up
termite-3.4.zip	u

Extract both **nodemcu-flasher-master.zip** & **kamoteq-main-firmware-bin-files.zip**

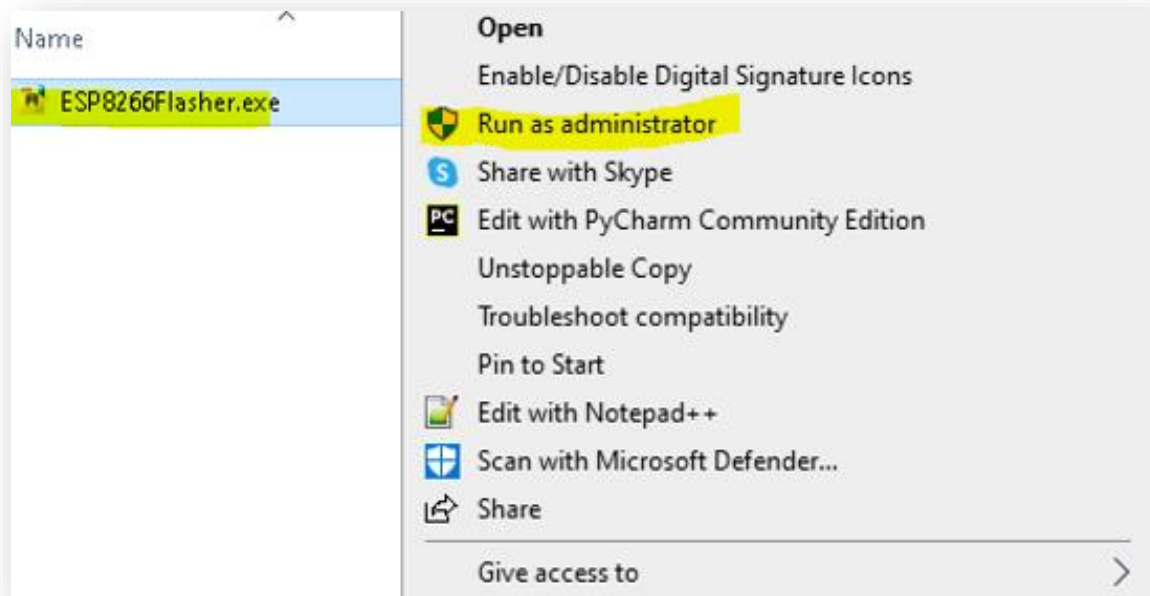

Open the “**nodemcu-flasher-master**” folder

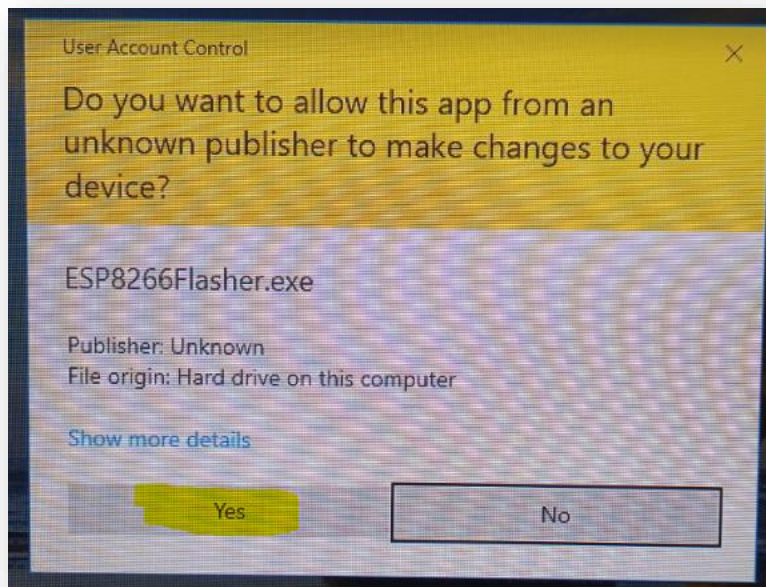

look for the **ESP8266Flasher.exe** inside the **Win64\Release** folders

Right-click the executable file and select the **“Run as Administrator”**

When asked to allow? You can click “Yes”

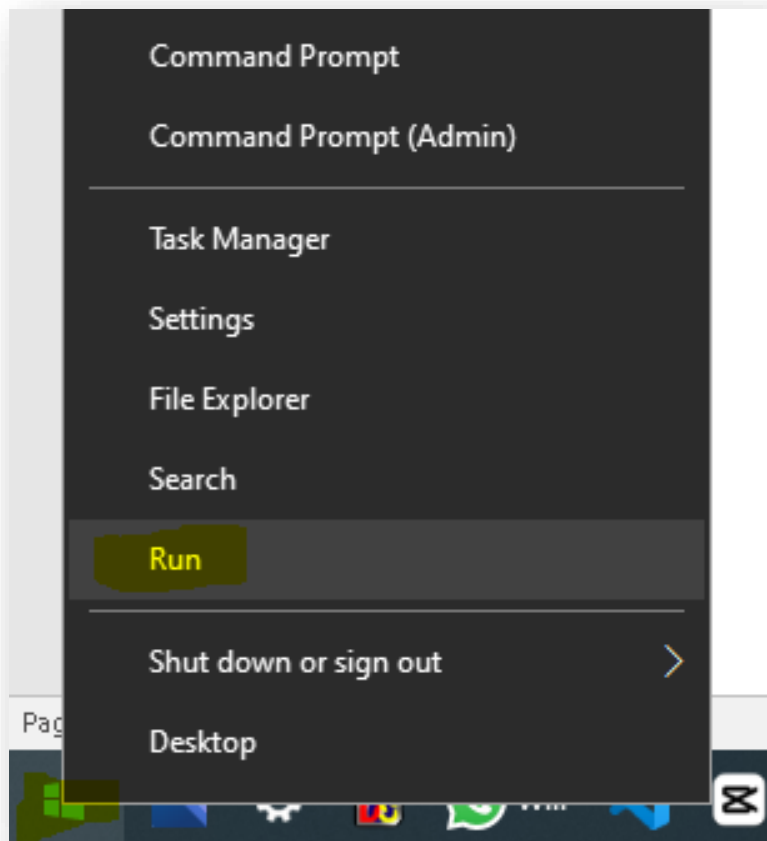

Connect the **esp8266 nodeMCU** to your computer using the micro-USB cable

Make sure you place the nodeMCU in a non-conductive material to avoid damaging

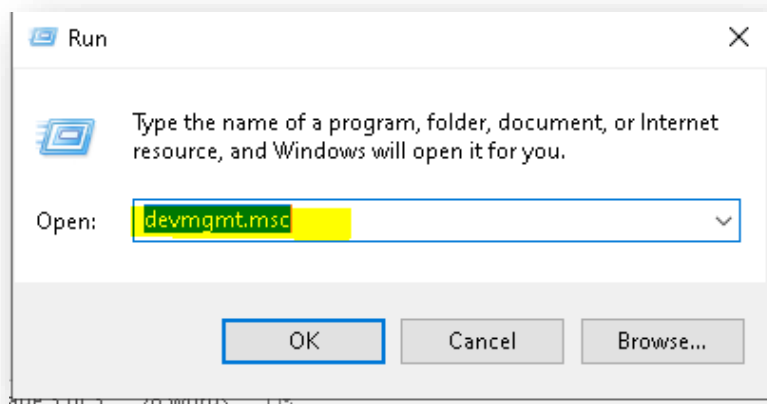

The microcontroller.

Open RUN by right-clicking Window Logo  and clicking “Run” 

Enter "**devmgmt.msc**" to open the device manager

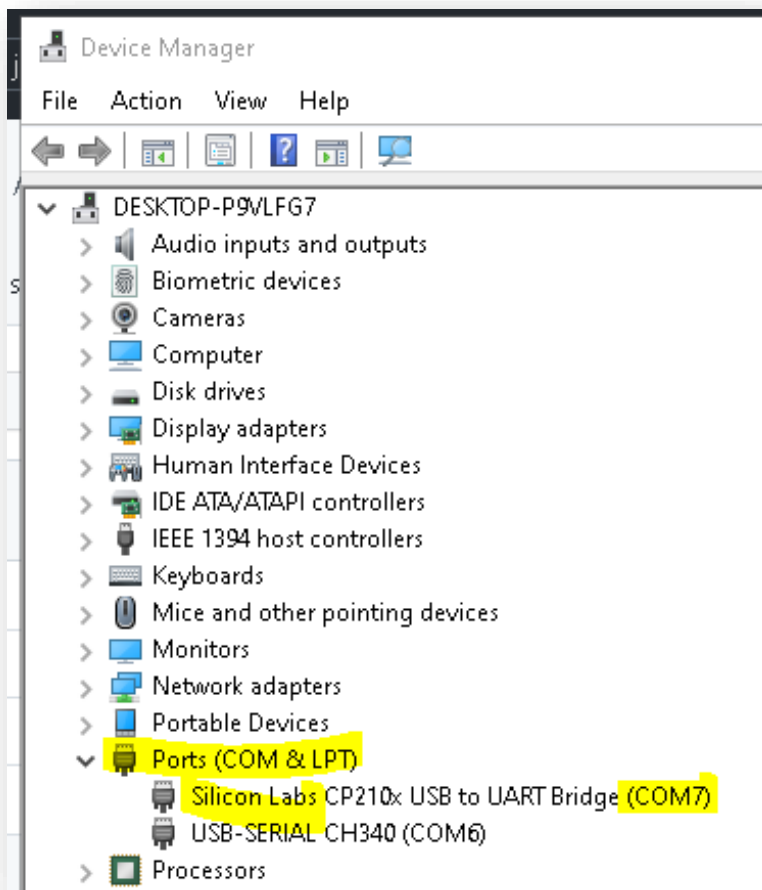

When asked/if it asked to allow the app just click "**Yes**"

Expand the Ports (COM & LPT), and take note of the **COM Port Number**

And in below example, it's COM7

Note. If you cannot find the correct COM number because you suspected that

Windows Operating system is unable to correctly detect the driver

Then download and install the driver manually

[Google Drive](#)

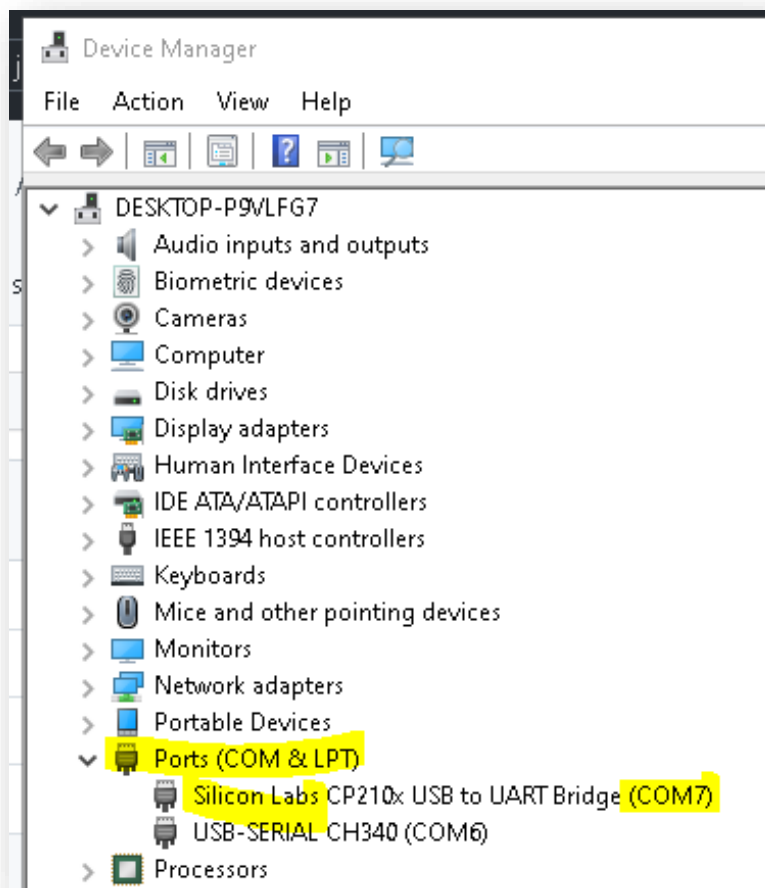

or directly download from this link

https://www.silabs.com/documents/public/software/CP210x_Windows_Drivers.zip

extract the zipped folder and

run the below executable file **CP210xVCPInstaller_x64.exe**

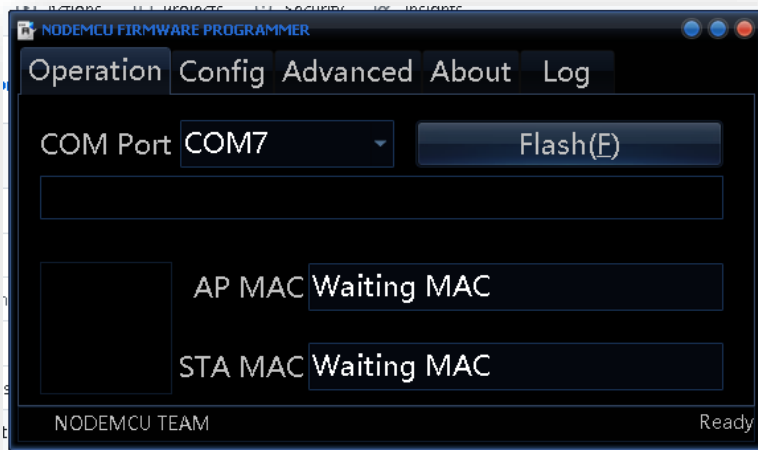

Name	Size
..	
x86	3,185,128
x64	3,623,392
v6-7-6-driver-release-notes.txt	15,553
slabvcp.inf	7,509
slabvcp.cat	10,970
SLAB_License_Agreement_VCP_Windows.txt	8,370
dpinst.xml	11,568
CP210xVCPInstaller_x86.exe	924,408
CP210xVCPInstaller_x64.exe	1,049,848

In the above example, we got **COM7** but chances are this will be different from yours so make sure you follow the above steps and get the correct port number,

Now let's go back to the NodeMCU flasher and on the first tab "**Operation**" select the correct COM port number

Example below

And on the "**Config**" tab click the small gear icon and find the Extracted folder "**kamoteq-main-firmware-bin-files**"

Name	Date modified
.git	1/23/2023 6:42 AM
alexa-voice-command-demo	1/20/2023 7:37 PM
ESP8266Flasher	1/21/2023 8:06 AM
ipscan-win64-3.9.0	1/21/2023 9:20 AM
java-sdk	1/20/2023 3:48 PM
kamoteq-main-firmware-bin-files	1/21/2023 9:46 PM
kamoteq-password-eraser-bin-file	1/20/2023 2:33 PM
openhab-switch-habpanel-demo	1/20/2023 7:38 PM
siri-voice-command-demo	1/20/2023 7:39 PM
termite-3.4	1/21/2023 9:28 AM
xloader	1/21/2023 10:46 AM
.gitattributes	1/20/2023 2:31 PM
CP210x Windows Drivers.zip	1/23/2023 7:33 AM

Always choose the folder with the highest version

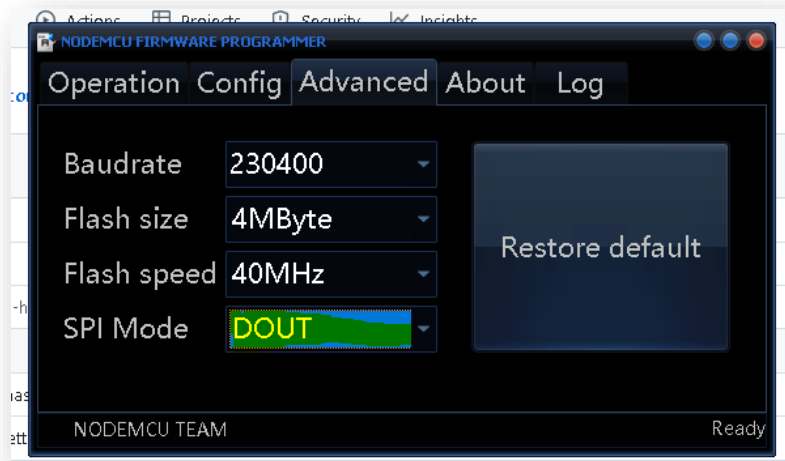

» Arduino » kamoteq-repo » kamoteq-main-firmware-bin-files

Name	Date modified	Type
v1.0	1/21/2023 4:13 PM	File folder
v1.1	1/21/2023 9:46 PM	File folder

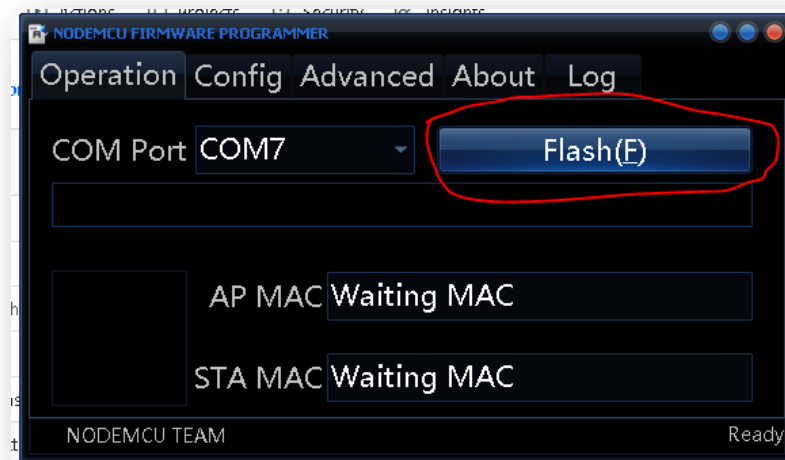

Note: there are three bin files corresponding to the three DHT available models just select which one matches your currently connected DHT sensor
For example, if in your setup using a DHT22-type sensor then you must select the “NodeMCU-ESP8266-DHT22.ino.nodemcu.bin”

..
dht11.bin
dht21.bin
dht22.bin

And last, on the “**Advance**” tab leave everything default except!
 The SPI Mode – change it to “**DOUT**”

Go back to the “Operation” tab and start the flashing,
Click the “Flash(E)” button now

This will take less than a minute or max of two minutes for slow computer,
if it's taking you more than that, click Stop and verify the COM port number
and the cable is properly connected on both PC/LAPTOP and
nodeMCU device and try again.

If completed without error, then Congratulations! If in the
case you receive any error during the process, just repeat the steps again.

This completes STEP 1 (KAMOTEQ Firmware Upload)

Proceed to STEP 2 (WIFI Network Registration)

*Disclaimer: Avoid interrupting the device during flashing this is a critical stage of the process It can make
your device useless*

Abruptly interrupted

End
