# Step 2

## **WIFI Network Registration**

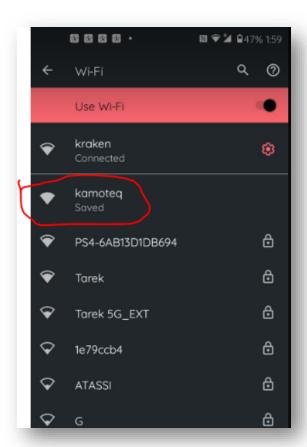

Registering the WIFI Network

1. Reset your device

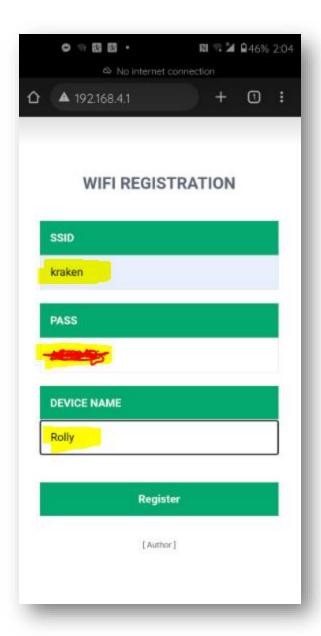

2. Get your laptop or smartphone or tablet or anything that can connect to a WIFI network and has an internet browser like google chrome browser

3. Open the WIFI and find and connect to the "kamoteq" hotspot and verify that you successfully connected to the "kamoteq" network

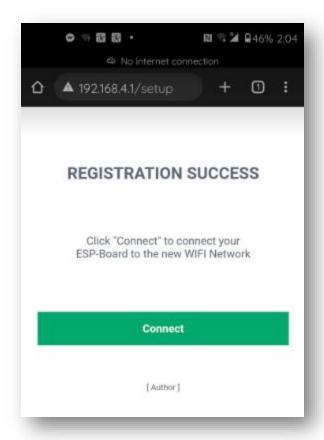

4. Open the Google Chrome browser and enter <a href="http://192.168.4.1">http://192.168.4.1</a> and a registration page will load, In the registration form, enter your HOME WIFI network SSID, PASSWORD, and the new NAME for your ESP device

Note. Please make sure the password has no extra white spaces at the end.

5. After clicking the register button, the confirmation page will load, and to finalize the process just click "Connect" this will reset your device and your device will attempt to connect to the HOME WIFI network you registered, if all credentials are correct this will connect your device without any error.

Note. After clicking Connect, it will load an error page, since this will reset the device and the page will not be available, this is normal.

6. Wait for a minute or two, this will connect your device to your home WIFI Network

#### LEAVE YOUR MOBILE NOW AND GO BACK TO YOUR COMPUTER/LAPTOP

7. To test the new ESP device, open the Google Chrome browser IN YOUR COMPUTER/LAPTOP and enter <a href="http://<device-name">http://<device-name</a>/ a page will load with details on how to control the newly configured ESP device

Note. make sure you replace <device-name> with the device name you registered

like for example I registered "rolly" so in the browser I will just type rolly/ or http://rolly/

SETTINGS AND CONFIGURATIONS				
	HTTP Request		Syntax	
Base-Url			http://rolly/500291dd0ff	
Base-Url			http://192.168.100.2/500	0291dd0ff
Get global data				
Get GPIO4 current pin				
Set GPIO4 pin to HIGH	(mode=on,1,true would result s	ame effect)	/?req=set&pin=4&mode	
	Control of the Contro	ame effect)	/?req=set&pin=4&mode	
Set GPIO4 pin to LOW	(mode=on,o,raise would result s

This Page concluded that the registration and configuration are successful!

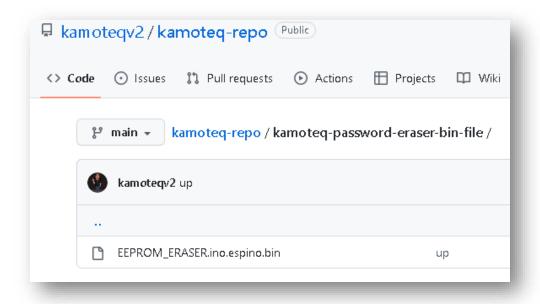

## Congratulations!

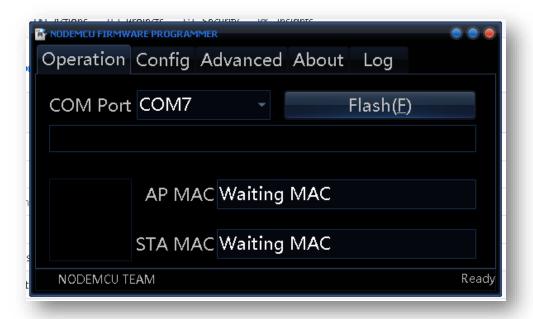

If in case you receive an error, just repeat the process,

and if you made a mistake with the password this must be erased, on <u>GitHub</u>, there is a special bin file to erase the password. https://github.com/kamoteqv2/kamoteq-repo/tree/main/kamoteq-password-eraser-bin-file

use the below bin file to flash out the old password

### in your ESP device using the nodeMCU flasher

This completes the STEP 2 (WIFI Registration)

Proceed to STEP 3 (Java Installation and Configuration)
